Why do you need good product photos?

- ⦿ **Good product photos are critical to how you present yourself and your art**
- ⦿ **Potential customers will be deciding whether to visit you based on the images you present**
- ⦿ **Bad photos reflect poorly on the quality of your art**

Let's look at some examples

- **Images submitted from past years**

What's a good image?

- ◉ **Well composed**
- ◉ **Well exposed**
- ◉ **Clear / sharp**
- ◉ **Accurate color**

Some Good Examples

Well composed

Well exposed

Clear / sharp

Accurate color

What do I need to give SVOS?

○ For the directory and website:

- Jpeg (.jpg) file type
- Resolution: 300 dpi
- 1800 pixels (6") wide
- sRGB color space
- Smaller versions will be generated automatically if needed
- See svos.org/image_guide.php for more info

Equipment:

What do I really need?

- **Almost any digital camera is OK**
 - Don't need high res
 - But color accuracy is important
 - Cell phones can be fine
 - But check your results
- **Lighting**
 - Need enough for subject to be well-lit
 - Natural, room or spot lighting can all work
 - Flash not recommended, unless you can use it well
- **Tripod – recommended**
 - Avoids blurring, aids composition
 - Can use Gorilla-type, beanbag, or any stable support

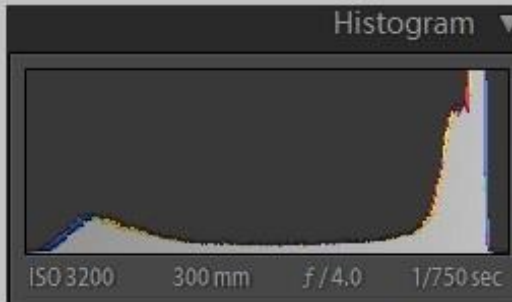

Lighting is Critical

- **Make sure your subject is well lit**
- **Avoid flash – unless you know what you’re doing!**
 - **Flash “hotspots” (reflections) and flash shadows are hard to avoid and hard to fix**
 - **Use a diffuser or reflector for indirect light**
 - **Fill flash (low intensity) can help reduce shadows**
- **Natural light (or natural color lighting) is best**
 - **Avoid direct sun – too much contrast**
 - **Overcast / indirect light can be good**
 - **Can use reflector or added light to lighten up shadow areas**
- **Light from front or side angle**
 - **Front provides most light, but can be flat**
 - **Sidelight enhances detail**
 - **Avoid backlight except for glass or translucent subjects**

What Camera Settings Should I Use?

- **Mode – use Auto, Program, or Aperture mode**
 - Mostly, use Auto or Program mode (standard for cell phones, point and shoots)
 - Use Aperture to control Depth of Field (background blurring)
- **Auto focus – use center or center weighted**
 - Pick your focal point, then re-compose if necessary to shoot
- **Flash – don't use direct flash**
 - Use fill (reflected) light or fill flash if some parts are too dark
- **Color/white balance**
 - Wrong white balance will shift your colors – common problem
 - Use Auto White Balance only if your colors look right with it
 - Otherwise set WB for type of light on subject (sun, shade, etc.)
 - Use true color lighting if available to avoid color casts
 - Can edit afterward, but easier to check on the spot

Check Exposure Histogram

Difficult exposure

Good balance

Adjust exposure +/- if needed

Composition

- **Fill the frame with one piece**
 - **Get rid of mat & frame but don't cut off the art**
 - **Move or zoom if needed**
 - **Leave a little room around the edges**
 - **Crop and straighten afterward with editor if needed**
- **Avoid perspective distortion**
 - **Shoot straight on (horizontal and vertical),**
 - **Use perspective correction in editor if needed**
- **Avoid distracting backgrounds**
 - **Re-position or block out distracting elements**
 - **Blur with wide aperture (f/4 or lower)**

Post Processing (Editing)

- **Get it right in camera as much as possible**
 - Some problems can't be fixed with editing
- **Shoot in raw mode (+jpg) for more editing options**
- **Common adjustments**
 - Brightness (exposure), contrast, color, cropping, rotation, perspective, sharpening, cloning/deleting, resizing
 - Do general adjustments first, then local adjustments
- **Can't fix:**
 - Out of focus, depth of field, motion blur, bad framing or composition
- **Be careful with sharpening**
 - Over-sharpening can introduce annoying artifacts like 'halos'
- **Save to sRGB for uploading to SVOS**
- **Software**
 - Lightroom, Photoshop, PS Elements, many other low cost options

Other Tips

- **Use your best image(s) for the catalog**
- **Use new images every year**
- **If photography isn't your strong suit, have a pro do it for you**
- **It pays to have good images for the directory**
- **Look for Image Guidelines on SVOS website**
 - **http://svos.org/image_guide.php**
